

→ Nervous system is made up of specialized cells called the neurones.

Dendrites:

* A Branch-like structure that functions by receiving messages from other neurones and allow the transmission of messages to the cell body.

Cell Body:

* Each neurone has a cell body with a nucleus, golgi apparatus, endoplasmic reticulum, mitochondria and other components.

Synaps:

* Synapses are the nerve ending of neurone, where the neural impulses are transmitted between each neurone.
